//note="Organ: eye; Vector: pT773-Pac (Pharmacia) with a
modified polylinker; Site_1: EcoR I; Site_2: Not I;
UI-8-EJO is a subtracted CDNA library constructed
according to Bonaldo, Lennon and Soares, Genome Research,
6:791-806, 1996. First strand cDNA synthesis was primed
with an oligo-dT primer containing a Not I site. Double
stranded cDNA was ligated to an EcoR I adaptor, digested
with Not I, and cloned directionally into pT773-Pac
vector. The oligonucleotide used to prime the synthesis of
first-strand cDNA contains a library tag sequence that is
located between the Not I site and the (dT)18 tail The
sequence tags for this library are: fetal eyes, AGAATCAAGA
; lens, CGATTAAGGA; eye anterior segment, AATGCCGCAT;
optic nerve, CCATTAAGTG; retina, CCGCG; Retina Foveal and
Macular, GTCC; RPE and Choroid, ACCTA. This library was
created for the program, Gene Discovery in the Visual
System, supported by National Eye Institute (NEI)."

                                                                                                                                                                                                                           /note="Organ: eye; Vector: DT73-Bac (Pharmacia) with a modified polylinker; Site 1: EcoR I; Site 2: Not I; UI-E-EJO is a subtracted CDNA library constructed according to Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1996. First strand cDNA synthesis was primed. with an oligo-dT primer containing a Not I site. Double stranded cDNA was ligated to an EcoR I adaptor, digested with Not I, and cloned directionally into pT773-Pac vector: The oligonucleotide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (dT)18 tail. The sequence tags for this library are: fetal eyes, AGAATCAAGA; lens, CGATTAAGGA; yee anterior segment, AATGCGGCAT; optic nerve, CCATTAAGTG; retina, CCGCG; Retina Foveal and Macular, GTCC; RPE and Chorold, ACCTA. This library was created for the program, Gene Discovery in the Visual System, supported by National Eye Institute (NEI).

                                                                                                                                                                                                                           The present sequence is the cDNA encoding the human chisel gene (Cs1)
C that is mapped to the human chromosome Xq21.3-q22. It comprises 5 exons.
C It is a member of the EF-Hand protein super family and is involved in
Signalling pathways. It is predominantly expressed in heart and skeletal
C muscles and is activated after the differentiation of cells. Cs1
C functions in regulation aspects of differentiation or adaptive processes
C that maintain muscle homeostasis. This sequence can be used in the
C detection, diagnosis, prophylactic and therapeutic treatment of diseases
Such as those involving aberrant muscle cell development and functional
C activity. It is also used in the treatment of muscular and myotonic
C dystrophies, skeletal myopathies such as Duchenne muscular dystrophy and
C myocarditis, myofiber atrophy, etc. The Cs1 gene sequence can also be
C used in gene therapy, for the production of transgenic animals and for
                                                                                                                                         Matches

                                                                                                                                                                                                                                                                 र्
                                                                                                                                                                                                                                                                                                                                                                                                    The patent discloses novel target genes abnormally expressed in heart tissues and their corresponding proteins. The invention also relates to methods for assessing the expression level of these genes. The method is used for testing the predisposition of mammals and preferably humans for a heart disease or for an acute state of such a disease. It is also useful to treat diseases of the heart such as congestive heart failure, cordinative cardiomyopathy, hypertrophic cardiomyopathy, ischaemic cardiomyopathy, specific heart muscle disease, rhythm and conduction disorders, syncope and sudden death, coronary heart disease, systemic arterial typertension, pulmonary hypertrension, pulmonary heart disease, valvular heart disease, congenital heart disease, pericardial disease and condocarditis. Sequences of the invention are also used in gene therapy. A transgenic non-human mammal comprising the sequences of the invention are useful for the development for medicaments for the treatments of heart disease. The present DNA sequence is expressed sequence tag
                                                                                                                                                                                                                                                                                                  Query Match

Disclosure; Page 104; 444pp; English

The invention relates to a method of diagnosing (I) the onset or CC progression of benign prostatic hyperplasia (BPH), or screening (II) for CC or identifying an agent that modulates the onset or progression of BPH. CC The method is based on changes in gene expression in BPH tissue isolated CC from patients exhibiting different clinical states of prostate (CC hyperplasia as compared to normal prostate tissue. (I) compirises (CC detecting the expression levels of one or more genes in prostate cells (CC from the subject that are differentially regulated compared to normal CC prostate cells. (II) comprises preparing a first gene expression profile (CC agent, preparing a second gene expression profile to the agent exposing the first and second gene expression of BPH. (II) is (CC agent, preparing the first and second gene expression of BPH. (II) is useful for diagnosing the onset or progression (CC agent) for identifying an agent that modulates the onset or progression (CC agent) for identifying an agent that modulates the onset or progression (CC agent) for identifying an agent that modulates the onset or progression (CC agent) for identifying an agent that modulates the onset or progression (CC agent) for in the specification in the tissue or cells to the (CC expression level in a tissue or cells, by comparing the expression (CC level of genes given in the specification in the tissue or cells to the (CC expression of gene in the database, and displaying the compared to the expression level in BPH. Agents using (II) are useful for treating BPH or prostate cancer. ABK64106-ABK64860 represent human (CC agent) agent agent agent agent in the database or cells to the compared to the expression level in BPH. (CC agent) are useful for the expression prostate cancer. ABK64106-ABK64860 represent human (CC agent) are useful for the cancer. prostatic hyperplasia gene sequences of the invention.

Screening for anti-neoplastic agent involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, and determining a change in expression of a gene of a signature gene Bet

Claim 1; SEQ ID 2927; 44pp; English.

CC The present invention describes a method (M1) for screening for an CC anti-neoplastic agent. The method involves exposing cells to a chemical CC agent to be tested for anti-neoplastic activity, determining a change in CC expression of at least one gene (I) of a signature gene set, where (I) CC comprises a sequence (S) selected from 8447 sequences (given in ABL61664 CC to ABL70110), or is at least 95% identical to (S), where a change in CC expression is indicative of anti-neoplastic activity. (I) has cytostatic CC activity and can be used in gene therapy. M1 can be used for screening CC an anti-neoplastic agent, and can be used for producing a product which CC is the data collected with respect to the anti-neoplastic agent as a CC result of M1, and the data is sufficient to convey the chemical CC treatment of cancer such as colon, breast, stomach, lung, thyroid, CC cesophageal, ovarian, kidney, prostate or pancreatic cancer, CC infiltrating lobular cancer, squamous cell carcinoma, neuroendocrine CC carcinoma, papillary carcinoma and Wilm's tumour.

Claim 3; Page 148; 157pp; English

The present sequence is the cDNA encoding the murine chisel gene (Cs1) that is mapped to the mouse X chromosome. It is a member of the EF-Hand protein super family and is involved in signalling pathways. It is predominantly expressed in heart and skeletal muscles and is activated after the differentiation of cells. Cel functions in regulation aspects of differentiation or adaptive processes that maintain muscle of differentiation or adaptive processes that maintain muscle comprophylactic and therapeutic treatment of diseases such as those prophylactic and therapeutic treatment of diseases such as those prophylactic and therapeutic treatment of diseases such as those involving aberrant muscle cell development and functional activity. It is also used in the treatment of muscular and myotonic dystrophies, skeletal myopathies such as Duchenne muscular dystrophy, and Becker's myotonic dystrophy, heart failure, cardiac hypertrophy, myocarditis, cardiac hypertrophy, myocarditis, myofiber atrophy, etc. The Cel gene sequence can also be used in gene therapy, for the production of transgenic animals and for drug screening.

An ORF has been identified within the sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed ORTA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 1' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain unstream reconstants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 428 BP; 123 A; 111 C; 104 G; 90 T; 0 other;

The patent discloses novel target genes abnormally expressed in heart tissues and their corresponding proteins. The invention also relates to methods for assessing the expression level of these genes. The method is used for testing the predisposition of mammals and preferably humans for a heart disease or for an acute state of such a disease. It is also useful to treat diseases of the heart such as congestive heart failure, collative cardiomyopathy, hypertrophic cardiomyopathy, ischaemic cardiock myopathy, specific heart muscle disease, rhythm and conduction disorders, syncope and sudden death, coronary heart disease, systemic arterial hypertrension, pulmonary hypertrension, pulmonary hypertrension, pulmonary heart disease, valvular cheart disease, congenital heart disease, pericardial disease and conducarditis. Sequences of the invention are also used in gene therapy. A transgenic non-human mammal comprising the sequences of the invention care useful for the development for medicaments for the treatments of the invention are disease. The present sequence is a cDNA from 66214 clone. This sequence used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; congestive heart failure; dilative cardiomyopathy; sudden death; hypertrophic cardiomyopathy; ischaemic cardiomyopathy; rhythm disorder; heart muscle disease; conduction disorder; coronary heart disease; systemic arterial hypertension; pulmonary hypertension; endocarditis; pulmonary heart disease; valvular heart disease; pericardial disease; congenital heart disease; gene therapy; syncope; transgenic animal;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Identifying a subject at risk for a heart disease e.g. congestive heart failure, dilative cardiomyopathy, heart muscle disease, by quantifying the polypeptide expressed by genes abnormally expressed in heart tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Example 10;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               30-MAY-2000; 2000US-207400P

cc biological sample, in expression profiling studies, in qualitatively or quantitatively characterising the corresponding transcriptome, and in cc quantitatively characterising the corresponding transcriptome, and in cc transcriptomes. The libraries may also be used as specialised mini cc libraries to detect transcripts of a sub-transcriptome under a garticular biological or pathological state, and so allowing the conjugation of tissue- and pathology-specific genes such as those genes conjugation; to detect developmental specific genes such as those genes conjugation; to detect developmental specific genes and to detect RNA transcripts and splice variants of a transcriptome of a pathological conjugation; to detect developmental specific genes; and to detect RNA cranscripts and splice variants of a transcriptome of a pathological coligonucleotide sequences from rats, humans and mice, which are used in the exemplification of the present invention.

N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at figure proposed the printed of the printed specification, but was obtained in electronic format directly from WIPO at figure proposed the printed specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         멼
                                                                                                                                                                                                                                                                                                                                                                 transcription units that populate a genome. The library comprises several oligonucleotides, each capable of hybridising selectively to set of messenger RNAs transcribed from a given transcription unit of the genome, which encodes one or more messenger RNA splice variants. The oligonucleotide libraries are useful for detecting mRNAs from a biological semple in expression are useful for detecting mRNAs from a biological semple.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New oligonucleotide libraries comprising oligonucleotides which selectively hybridize to mRNAs transcribed from a transcription a genome, useful for detecting tissue-, pathology-, and

                                                                                                                                                                              quantitatively characterising the corresponding transcriptome, and in detecting RNA transcripts and splice variants of human or animal transcriptomes. The libraries may also be used as specialised mini libraries to detect transcripts of a sub-transcriptome under a particular biological or pathological state, and so allowing the detection of tissue and pathology-specific genes such as those genes only expressed in specific tissue under a specific pathological condition; to detect developmental specific genes; and to detect RNA transcripts and splice variants of a transcriptome of a patient suffering from a particular disorder. ABN27253'to ABN9588 represent oligonucleotide sequences from rats, humans and mice, which are used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                    (sub-)transcriptome comprises messenger RNAs transcribed from multiple transcription units that populate a genome. The library comprises several oligonucleotides, each capable of hybridising selectively to a set of messenger RNAs transcribed from a given transcription unit of the genome, which encodes one or more messenger RNA splice variants. The oligonucleotide libraries are useful for detecting mRNAs from a biological sample, in expression profiling studies, in qualitatively or

                                                                                                                                                                                                         genes which are modified by the methylation of cytosines. The sequence can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid leukaemia, Alzheimer's disease, AIDS, epilepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention.

CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The polymetics are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques CC (II). (II) is useful for generating antibodies against it, detecting or guantitating a polypeptide in tissue, as molecular weight markers and as cc. (II) and (II) and (II) are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating CC imaging of sites expressing (II). (I) and (II) are useful for treating CC disorders involving aberrant protein expression or biological activity. CC disorders involving aberrant protein expression or biological activity disorders involving aberrant protein expression or biological activity. CC and to produce other types of data and products dependent on DNA and to produce other types of data and products dependent on DNA and diagnostic coding sequences of the invention.

CC Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               RESULT 11

                                                                                                                                                                                                                                                                                                                                                                                                                                                                  enzyme in lipolysis) and inhibiting acetyl CoA carboxylase (the key enzyme in lipolysis) and inhibiting acetyl CoA carboxylase (the key enzyme in lipogenesis). The growth hormone fragment preferably contains at least the disulphide-bonded loop of a mammalian growth hormone (but is not the full-length growth hormone) and is optionally linked to an epitope tag or heterologous fusion protein partner. The transgenic organism may be a microorganism used to produce a fermented product (e.g., yeast), or an edible plant or animal or cell thereof. Food or cratio, lipid metabolism or food use in a mammal. In particular, the food or drink products may be used to improve the fat/lean ration of livestock raised for meat production. In the exemplification of the invention, the human growth hormone (hGH) fragment analogue AoD9604 was expressed in yeast, optionally fused to the FLAG epitope (AAB73625).

The present sequence is described as a DNA sequence from yeast in the sequence listing, but is not further referred to in the

The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid leukaemia, Alzheimer's disease, AIDS, epilepsy, neurofibromatosis, rheumatoid arthritis, psoriassis and inflammatory/ulcerative bowel

The present invention describes a method of screening for genes which modulate polyglutamine toxicity using animal models with polyglutamine sequences that cause toxicity in the animal. The model is preferably prosophila, and toxic polyglutamine sequences include the human and prosophila heat shock protein 40/HDJ1, tetratricopeptide repeat protein (TPR2) and myeloid leukaemia factor 1 (MLF) genes. The model is useful for identifying treatments for neurodegenerative and proliferative disorders, including Alzheimer's disease, Parkinson's disease, Creutzfeldt-Jacob's disease (CJD), bovine spongiform encephalopathy (BSE), Huntington's disease, Machado-Joseph disease, spinocerebellar
                                                                                                                                                                                                                                                                                                          12-AUG-1999;

                                                 useful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
                                                                                                           The invention relates to an isolat capable of detecting 1000 or more
                          The sequence data for this patent did specification, but was obtained in ele
